

LifeChip®

With Bio-Thermo® & Bio-Bond® Technology

Your pet is special enough to carry its own thermometer.

With Destron Fearing Bio-Thermo Microchip, not only does your pet have the most advanced and the first true anti-migration microchip that meets all required standards, but also has the extra advantage of a revolutionary built-in thermometer.

LifeChip takes advantage of Destron Fearing's unique Unitary Core construction and Biobond Anti-Migration technology to

provide superior reliability and increased read distances compared to ordinary microchips.

What does that mean?

When your pet needs hospitalization for routine surgery or has an emergency the veterinary staff will be able to monitor your pet's temperature 24 hours a day without disturbing your pet and without the discomfort of rectal temperature readings.

It also means that the microchip will stay where it was placed and not move around potentially causing problems or be difficult to locate and read. Destron's Unitary Core construction is patented technology that improves chip read distance and durability. Destron LifeChips are guaranteed to last for more than 20 years.

How LifeChip works

LifeChips are tiny integrated circuits with an antenna that is encapsulated in medical grade glass. They are passive meaning there is no battery to provide power. The LifeChip is powered through an electromagnetic field generated by a special transceiver that activates the LifeChip to provide its unique 15 digit identification number.
